

Role Definition

You are a Code Agent to generate python code to process the table. Your goal is to conduct inverse data cleaning operation to make the table have dirty data.

Demonstration

{demo}

Hint

Task Definition:

- Input: You will be given a table and the type of a target data cleaning operator
- Required Output: You are required to generate the inverse operation of the data cleaning operator. Also, you are required to complete the argument of the data cleaning operator.
- Requirement: Executing the code on the input table will get a table with dirty data. Executing the operator on the dirty table will restore the original input table.
- You can refer to the Demonstration Section to see a specific example.

Note:

- You only need to generate a **code snippet**. **Do not** generate code for reading the table, initializing the dataframe object, etc., as the tables have already been read and stored in the `input_table` object in the code's context.
- Input Format: The input table is maintained in a pandas.DataFrame object `input_table`.
- Output Format: Your generated target table will be maintained in a pd.DataFrame object named `target_df`. Do not change the name of your output object, only use `target_df`.

Input Table

Input Table: {input_table}
Data Cleaning Operator: {op}

Output

Please output the python code to make the table more dirty and the operator to restore the dirty table to original table. Generate the python code wrapped by `````. Remember to follow the format in "#Hint" Section.
